

Fasteners & fixings

KNOW HOW

To drill a depth hole for anchoring

The hole depth must, with only a few exceptions, be longer than the anchoring depth. That is because functional safety is only ensured if the screw has enough room to project beyond the tip of the plastic fixing.

Hole cleaning after drilling, by blowing or suction, is indispensable. A hole that is not cleaned reduces the holding forces. The drilling dust has a negative effect on the proper functioning of the fixing in the hole.

Did you know?

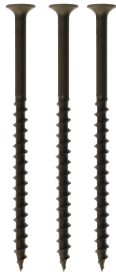

A chipboard screw or particleboard screw is a self tapping screw with a thin shaft and coarse threads. The screws solidly fasten chipboard to chipboard, or to other materials such as natural wood.

Because chipboard has no natural grain to resist the screw from withdrawing, chipboard screws often have grippers around their head called nibs. Many chipboard screws are self tapping, so there is no need to bore holes first.

Did you know?

When adding an anchor to drywall, you don't need a drill & bit. All you need to do is turn the screw into the drywall (slowly, so as not to go crooked & making the hole wider than needed), and then back it out, then tap in your anchor, and insert the screw into the anchor.

If a metal anchor is too long and won't drill flush into the drywall, drill the hole initially and then snap off the teeth at the end of anchor with a pair of pliers. This should give you some more room.

STEEL EXPANSION ANCHOR

- Exclusive • Easy to use with good load carrying capacity
- Excellent tolerance to variation in hole size
- Collapsible ferrule ensures positive clamping force

DESCRIPTION	SIZE	ART CODE
